**Novelty:** The printer has exposure system to form latent image comprising invisible bar code and identification information on light sensitive drum. The identification information and invisible bar code as the latent image are developed using two different developing agent cartridges (340a-d, 340e).

**Detailed Description:** INDEPENDENT CLAIMS are also included for the following:

- (a) Recording medium which stores identity card printing program;
- (b) Printing method of identity cards

**Use:** In e.g. laser printer for printing identity cards.

**Advantage:** Card printing time is shortened as invisible bar codes and ID information are simultaneously printed. Security is improved as the invisible bar code and information are printed on same layer which reduce the chances of separation of both information by peeling.

**Description of Drawing(s):** The figure shows the schematic sectional diagram of laser printer.
